Mohamed Ibrahim Mohamed Ahmed

Khartoum, Sudan (Remote) · modialmadih@gmail.com · +249129709315 · linkedin.com/in/almadih · github.com/Almadih

SUMMARY

Senior Backend Engineer with 7 years of building and running production systems in Laravel, Python, and Node.js. Built a crawler that processed about 100,000 websites a day and a Telegram bot that serves 40,000+ users. Known for taking over neglected codebases and making them tested, secure, and fast. Works best with high ownership in small, remote teams.

SKILLS

- **Languages:** PHP, Python, TypeScript, JavaScript, SQL
- **Backend:** Laravel, FastAPI, Celery, Node.js (Express), Next.js, REST APIs, gRPC, webhooks, authentication
- **Frontend:** React, React Query, Vue.js, Next.js, TailwindCSS, Flutter
- **Data:** PostgreSQL (PostGIS), MySQL, SQLite, Cloudflare D1, Redis, Prisma
- **Infrastructure:** Docker, Linux, Nginx, Cloudflare Workers, GitHub Actions, CI/CD
- **Practices:** Automated testing, legacy refactoring, query optimization, code review

EXPERIENCE

Fullstack Developer | Agilium | Riyadh, Saudi Arabia (Remote) | March 2025 - Present

Procurement planning and process automation platform (Laravel API, React frontend). Small team that also delivers client projects.

- Drove the modernization of a legacy Laravel API that had no tests, tangled structure, dead code, and unused dependencies. Refactored most of the codebase in steps, without pausing feature delivery.
- Built the backend test suite from zero to about 80% coverage, giving later refactors and releases a safety net.
- Hardened error handling, security, and query performance across every module rewritten.
- Migrated all React data fetching to React Query, adding caching and consistent server-state management.
- Own features end to end, from planning through the Laravel API and the React UI.

Software Engineer | StrangeLogic | Khartoum | August 2021 - January 2024

Startup of about 6 people behind a platform for finding and registering domains.

- Designed and built most of Domain Intelligence, a distributed crawling platform (Python, Celery, Docker) that collected domain and SEO data for a data product.
- Ran it in production at about 100,000 websites a day and terabyte-scale data. Used data partitioning to keep queries fast as volume grew.
- Built most of Bravo Tango, a data service for LinkedIn profile scraping and email validation, with async processing on Celery and Redis.
- Exposed Bravo Tango through a REST API, a CLI, and webhooks for client integrations, with gRPC between internal services.

Software Engineer | Freelance | Khartoum | October 2019 - Present

Backend and fullstack work for clients in Sudan and Saudi Arabia.

- Lead engineer on a live Laravel and Vue.js learning platform with about 600 students. Hired in October 2025 for a feature contract, then kept on to own bugs, security, and deployments.
- Fixed slow pages on the platform by optimizing the database queries that degraded as the student base grew.
- Redesigned the platform's entire UI in stages, ending with a new landing page.
- Built backend and frontend for fintech products: a payments platform for a Saudi client (TourPay, Laravel and Vue.js), a money transfer platform (Node.js and Vue.js), and a digital wallet (Node.js and Vue.js).
- Also delivered a store management system (Laravel and React) and a delivery app backend (Node.js).

PROJECTS

X/Twitter Video Downloader Bot | t.me/twitter_vid_dl_bot | TypeScript, Cloudflare Workers, D1

- Built and operate a Telegram bot for downloading X/Twitter videos: 40,000+ users, about 10,000 monthly active users, and 1,000+ downloads a day.
- Cut database reads as usage grew, with covering indexes, indexed UNION queries in place of multi-column OR scans, and in-memory caching of aggregate stats.
- Monetized it with paid plans. Built a broadcast engine, channel auto-posting, and an admin dashboard to run it.

Hindsight | hindsight.almadih.dev | github.com/Almadih/hindsight

- Launched a free chess game review tool that grades every move, estimates accuracy and rating, and adds AI coach notes. Works from a pasted game or a Chess.com or Lichess username.
- Runs Stockfish in the browser. A FastAPI service on Cloudflare Workers classifies moves, backed by D1, KV, and Workers AI, with a static Next.js frontend.
- Write-up: blog.almadih.dev/posts/building-hindsight-free-chess-game-review

Chess Academy | github.com/Almadih/chess-academy

- Built a local-first training app that imports a player's full Chess.com and Lichess history. Analyzes every game with Stockfish on background worker threads (FastAPI, SQLite).
- Turns the analysis into a training plan: recurring mistakes, opening lines that keep going wrong, and spaced-repetition puzzles built from the player's own errors.

diffcv | Next.js, Prisma, NextAuth, Stripe

- Built an AI platform for writing and tailoring resumes and cover letters. Ready for launch.
- Implemented subscription billing on RevenueCat and Stripe, with authenticated, idempotent webhooks.
- Designed per-user AI quotas that only count usage after a generation succeeds.

EDUCATION

Honors Bachelor in Information Technology | University of Bahri | 2021 | GPA 3.45
